$$\Omega S^n \longrightarrow PS^n \longrightarrow S^n$$

$$E_2^{p,q} \cong H^p(S^n; H^q(\Omega S^n)) \Rightarrow H^{p+q}(PS^n)$$

$$\begin{array}{c|ccccc}
 & 2\{q_3\} & & 2\{q_3x\} & \\
 3n-3 & \swarrow \cong & & \downarrow & \\
 & 2\{q_2\} & & 2\{q_2x\} & \\
 2n-2 & \swarrow \cong & & \downarrow & \\
 & 2\{q_1\} & & 2\{q_1x\} & \\
 n-1 & \swarrow \cong & & \downarrow & \\
 0 & 2\{x\} & \xrightarrow{d_n} & 2\{x\} & \\
 \hline & 0 & & n &
 \end{array}$$

Rem: cup product  
 is graded-commutative,  
 so  $a \cdot b = (-1)^{|a| \cdot |b|} b \cdot a$

By replacing some  $a_n$ 's with their negatives we

$$\text{can assume } d_n(a_1) = x$$

$$d_n(a_k) = a_{k-1}x \quad \text{for } k > 1.$$

We also note  $a_kx = x a_k$ , because  $|a_k| + 1 = \text{even}$

$n \text{ odd}$

$$\begin{aligned}
 d_n(a_1^2) &= d_n(a_1) \cdot a_1 + (-1)^{\frac{n-1}{2}} a_1 \cdot d_n(a_1) \\
 &= x \cdot a_1 + a_1 \cdot x = 2 \cdot a_1 \cdot x
 \end{aligned}$$

$$\begin{aligned}
 d_n(a_2) &= a_1x \\
 \Rightarrow a_1^2 &= 2a_2, \quad \text{because } d_n \text{ is odd.}
 \end{aligned}$$

$$\begin{aligned}
 d_n(a_1^k) &= d_n(a_1 \cdot a_1^{k-1}) = d_n(a_1) \cdot a_1^{k-1} + (-1)^{|a_1|} a_1 \cdot d_n(a_1^{k-1}) \\
 &= x \cdot a_1^{k-1} + a_1 \cdot d_n(a_1^{k-1})
 \end{aligned}$$

$$\star a_k = q_1^k / k!$$

$$q_m \cdot q_n = q_1^m / m! \cdot q_1^n / n!$$

$$= \frac{q_1^{m+n}}{m! n!}$$

$$\begin{aligned}
 &= x \cdot a_1^{k-1} + a_1 [d_n(a_1) a_1^{k-2} + a_1 \cdot d_n(a_1^{k-2})] \\
 &= x \cdot a_1^{k-1} + a_1^{k-1} x + a_1 d_n(a_1^{k-2}) \\
 &= 2x a_1^{k-1} + a_1 d_n(a_1^{k-2}) \\
 &\vdots \\
 &= k a_1^{k-1} x
 \end{aligned}$$

$$\text{By induction } a_1^k = k! a_k$$

$$\Rightarrow H^*(\Sigma S^n; \mathbb{Z}) \cong \bigoplus_{|a|=n-1} [a], \quad a \hookrightarrow a_1$$

n even  $|a_1|$  is odd,  $|a_1| \cdot |a_1| = (-1) \cdot |a_1| \cdot |a_1|$

$$\Rightarrow a_1^2 = 0.$$

$a_1 a_2$

$$\begin{aligned}
 d_n(a_1 a_2) &= d_n(a_1) \cdot a_2 + (-1)^{|a_1|} a_1 \cdot d_n(a_2) \\
 &= x \cdot a_2 - a_1^2 x \\
 &= x \cdot a_2 \\
 &= d_n(a_3)
 \end{aligned}$$

$$\therefore a_1 a_2 = a_3$$

Now claim inductively

$$a_1 a_{2k} = a_{2k+1} \quad [\Delta \text{ hence } a_1 a_{2k+1} = a_1 [a_1 a_{2k}]] \\ = 0$$

Indeed,

$$\begin{aligned}
 d_n(a_1 a_{2k}) &= x \cdot a_{2k} - \underbrace{a_1 \cdot a_{2k-1}}_{\textcircled{1}} \cdot x \\
 &= x \cdot a_{2k} = d_n(a_{2k+1}) \Rightarrow a_1 a_{2k} = a_{2k+1} \\
 a_1 a_{2k+1} &= 0
 \end{aligned}$$

The second claim is  $a_2^k = k! q_{2k}$ .

$$\begin{aligned} \text{We have } d_n(a_2^k) &= d_n(a_2^{k-1} \cdot q_2^{k-1}) = d_n(a_2) q_2^{k-1} + (-1)^{|q_2|} q_2 \cdot d_n(q_2^{k-1}) \\ &= q_1 \cdot x \cdot q_2^{k-1} + q_2 d_n(q_2^{k-1}) \\ &= k \cdot q_1 \cdot x \cdot q_2^{k-1}, \text{ inductively} \end{aligned}$$

By induction  $a_2^{k-1} = (k-1)! q_{2k-2}$  and so

$$\begin{aligned} d_n(a_2^k) &= k \cdot q_1 \cdot x \cdot (k-1)! q_{2k-2} \\ &= k! \cdot q_1 \cdot x \cdot q_{2k-2} \\ &= k! \cdot q_{2k-1} \cdot x \quad [\text{using } q_1 \cdot q_{2k-2} = q_{2k-1}] \\ &= k! \cdot d_n(q_{2k}) \\ \Rightarrow a_2^k &= k! q_{2k}, \text{ as claimed.} \end{aligned}$$

$$H^*(\mathbb{R}S^n; \mathbb{Z}_2) \cong \mathbb{Z}_2[a] \oplus \mathbb{Z}_2[b]$$

$$|a| = n-1 \quad |b| = 2n-2$$

$$a \hookrightarrow a_1 \quad b \hookrightarrow a_2$$
