Examination paper for **TMA4120 Calculus 4K**

Academic contact during examination: Eugenia Malinnikova, Yurii Lyubarskii

Phone: eugenia@math.ntnu.no, yura@math.ntnu.no

Examination date: one day in November

Examination time (from–to): 4 hours

Permitted examination support material: You need nothing but a pen/pencil, your head and a good mood! All the formulas you may need are in the attachment, see the last pages of the exam paper. However a simple calculator and Rottmann are still allowed on the final exam.

Other information:
This examination paper contains six problems with ten parts all together. Approximately a half of them is on Laplace transform, Fourier series and transform and their applications to differential equations and half on complex analysis. The problem parts are counted equally, though to pass the exam you should better pass both halves. Good luck!

Problem 1 Solve the initial value problem

$$y'' + 4y' + 4y = u(t-1), \quad y(0) = 0, \quad y'(0) = 1.$$

Problem 2 We consider the following boundary value problem

$$u_{tt} + 2u_t + u = c^2 u_{xx}, \; 0 < x < L, \; t > 0, \quad u(0,t) = u(L,t) = 0. \qquad (*)$$

a) Find all solutions of $(*)$ of the form $u(x,t) = F(x)G(t)$.

b) Compute the coefficients of the sine Fourier series $S_f(x) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{L}$ of the function $f(x)$ defined by $f(x) = x(L-x)$ for $0 < x < L$.

c) Find a solution of $(*)$ that satisfies the initial conditions

$$u(x,0) = f(x), \; u_t(x,0) = 0,$$

where f is a function defined in b).

Problem 3 Show that if $\hat{f}(w)$ is the Fourier transform of a function $f(x)$ then the Fourier transform of the function $f(x)\sin bx$ is equal to $\frac{i}{2}(\hat{f}(w+b) - \hat{f}(w-b))$.
Compute the Fourier transform of the function $g(x) = \begin{cases} \sin 2x, \; |x| \le 1 \\ 0, \; |x| > 1 \end{cases}$

Problem 4 Let $z_0 = i$. Determine the real and imaginary parts of

$$1 + z_0; \; \frac{1+z_0}{1-z_0}; \; \mathrm{Ln} z_0; \; \mathrm{Ln}(1+z_0).$$

Problem 5 Let $f(z) = \frac{\cos z}{z^2+1}$.

a) Find all zeros and singular points of $f(z)$, classify the singularities.

b) Compute $\oint_C f(z)dz$, where C is the circle of radius 3 centered at $z_0 = 1$.

c) Let $g(w) = f(1/w)$ show that $g(w)$ has essential singularity at zero. (Hint: consider the values of g on a set $0 < |w| < r$.)

Problem 6 Evaluate the integral $\int_0^{\infty} \frac{\cos 3x}{x^4+3x^2+2} dx$.
