

Read 4.3–4.4 of Chapter 4 in Lecture Notes.

**1** Friedberg et al, 2.2 problem 10

Let  $\{v_1, \dots, v_n\}$  be a basis for  $V$ . Show that there exists a linear transformation  $T : V \rightarrow V$  such that  $T(v_1) = v_1$ ,  $T(v_j) = v_{j-1} + v_j$ ,  $j = 2, \dots, n$ . Find the matrix of this transformation in the basis  $\{v_1, \dots, v_n\}$ .

**2** Let  $P(\mathbb{C})$  be the vector space of all polynomials and let  $T(p) = p^{(k)}$  be the  $k$ -th derivative of  $p$ . Find the range and the kernel of  $T$ .

**3** Let  $V$  be a finite dimensional vector space and  $T$  be a linear transformation. Show that the following three statements are equivalent

1.  $\text{ran}(T) \cap \ker(T) = \{0\}$ ,
2.  $\text{ran}(T) + \ker(T) = V$ , i.e., for any  $x \in V$  there exists  $y_1 \in \text{ran}(T)$  and  $y_2 \in \ker(T)$  such that  $x = y_1 + y_2$ ,
3.  $\text{ran}(T) \oplus \ker(T) = V$ .

Be sure you use that  $V$  is finite dimensional.

Hint: Apply the rank-nullity theorem.

**4** Friedberg et al, 2.3 problem 16

Let  $V$  be a finite-dimensional vector space, and let  $T : V \rightarrow V$  be a linear transformation. Prove the following statements.

- a)  $\text{ran}(T^2) \subset \text{ran}(T)$  and  $\text{rank}(T) \geq \text{rank}(T^2)$ .
- b) If  $\text{rank}(T) = \text{rank}(T^2)$ , then  $\text{ran}(T) \cap \ker(T) = \{0\}$ .  
Hint: Consider  $T : \text{ran}(T) \rightarrow \text{ran}(T^2)$ .
- c)  $V = \text{ran}(T^k) \oplus \ker(T^k)$  for some positive integer  $k$ .  
Hint: Use **b**) and Problem 2.

**5 Problem 5, Friedberg et al, 2.2 problem 13**

Let  $X$  and  $Y$  be vector spaces and  $T$  and  $S$  be linear transformations from  $X$  to  $Y$ . Suppose that  $\text{ran}(T) \cap \text{ran}(S) = \{0\}$ . Show that  $\{S, T\}$  is a linear independent set in  $L(X, Y)$ .

**6 Problem 2 from continuation Exam 2009**

- a) Let  $(X, \|\cdot\|)$  be a Banach space. Let  $T: X \rightarrow X$  be a continuous linear transformation. Let  $b \in X$  be a fixed vector.

Consider the map  $X \rightarrow X$  given by  $x \mapsto Tx + b$ . Express as simply as you can the condition that is needed for this to be a contraction.

- b) Recall that  $l_\infty$  is the space of all *bounded* sequences of real numbers with the supremum norm,

$$\|(\xi_n)\|_\infty = \sup\{|\xi_n| : n \in \mathbb{N}\}.$$

Let  $I: l_\infty \rightarrow l_\infty$  be the map

$$I(\xi_n) = \left(\frac{1}{n}\xi_{n+1}\right).$$

For example,

$$I(1, 1, \dots) = \left(0, 1, \frac{1}{2}, \frac{1}{3}, \dots\right).$$

Let  $b \in l_\infty$  be the sequence  $(1, 0, 0, \dots)$ . Prove that the map  $x \mapsto Ix + b$  is not a contraction on  $l_\infty$ , but that  $x \mapsto I(Ix + b) + b$  is a contraction. What is the contraction constant?

- c) Carry out the first five iterations (of  $x \mapsto Ix + b$ ) starting from  $x_0 = 0$ . Then carry out the first five iterations starting from an arbitrary sequence  $x_0 = (\xi_1, \xi_2, \dots)$ . What do you notice?

**7 Problem 2 from Exam 2012**

- a) Find an  $LU$ -decomposition of

$$A = \begin{bmatrix} 2 & 3 & 3 \\ 0 & 5 & 7 \\ 6 & 9 & 8 \end{bmatrix}.$$

What is  $\ker A$  and  $\text{ran } A$ ?

- b) Determine the coordinates  $(x_1, x_2, x_3)_A$  of an arbitrary vector  $y = (y_1, y_2, y_3)$  in the basis  $\{A_1, A_2, A_3\}$  given by the column vector of  $A$ .
- c) Perform a Gram–Schmidt orthonormalisation of  $\{A_1, A_2, A_3\}$ .
