Optimization II

Problem sheet 1

1. Consider the boundary value problem

$$y'' + p(x)y' + q(x)y = f(x) \text{ in },\quad y(0) = y(1) = 0,$$

with $p \in C^1[0,1]$, $q \in C[0,1]$. Derive the weak formulation in the appropriate function space and show that it has a unique solution if $p' - 2q > 0$. Is this also true for $p' - 2q = 0$?

2. Show that

$$F : C[0,1] \to C[0,1], \quad u \mapsto \int_0^1 \Big(u(t)^2 e^{t-7} + (3u(t)+13)\sqrt{t} - 17\tan(\ln(1+t^2))\Big)dt$$

is Fréchet- differentiable and compute its derivative.

3. Consider the function $f : I\!R \to I\!R$, $x \mapsto x^3$. For which combinations of $p, q \in [1,\infty]$, is the Nemytzki-operator

$$f : L^p(\Omega) \to L^q(\Omega),\ u \mapsto f(u)$$

Fréchet- differentiable and why?

4. Show that $\sin : L^p(\Omega) \to L^q(\Omega)$ is F-differentiable if $p = q = \infty$ or $p > q \geq 1$.
